

OS Forums Guide#

Project members are encouraged to [post](#) instead of using private email. Pick a forum to post to based on what you'd like to say or ask:

Name	What to post	
OSTech	Talk about code: -bug reports, -bug fixes, -code implementation, -system architecture. Post about tech topics like: -SMP / processes and memory management / Libraries/ Interrupt/ scheduling / magic / partitioning. Propose new code fixes or features. Post anything about the code itself. Post about anything linked from the OS Tech or OS Source Guide wiki pages.	
OSDev	Post about: -compile/build/debug problems and questions. -build tool chain Post your "make clean" or any build-related warnings. Post about any thing mentioned on the OS Developer wiki pages	
OSRev	Code Reviews: -Post your changes, in the form of diffs or zip files of old and new source. -Post any code changes to the OS for which you need other people to review. (QNX Kernel process requires all procnto changes to be code reviewed.) -Post your comments on other people's diffs here too.	
OSMeta	Post about everything else. Including: -issues of the os wiki infrastructure: wiki layout, organization, bugs, admin issues. -any OS or kernel general issue not covered in the other forums -beginner and general questions.	

See posting status at the [OS Forums Status](#) page.

Posting guidelines#

Someone suggested the rule "If you wouldn't say it to your Mom, don't post it here." But "mom" includes Dilbert's mom who can tell the difference between packet-routing networks and circuit-switching networks, and is, in general a bigger geek than Dilbert. So the only rules are:

- All postings must be civil.
- Off-topic posts must be humorous and not dominate the group.

How to create a new forum#

Propose the new forum with a posting to [OSMeta](#) and ask for comments. When a consensus is reached a project admin will create the group. Do the same if you think an existing group's mandate should be changed.
